

THE INCREDIBLE SPACE MAN BOOK LIGHT

It's one small step for book
lovers, one giant leap for
reading in the dark!

MIMAS

Mimas is the innermost and smallest of Saturn's major moons. It orbits within the ring system and cleared the region between the A and B rings to produce the Cassini Division. This ball of water ice and rock averages 397km (247 miles) in diameter. But Mimas is not quite spherical: it is about 30km (19 miles) longer than it is wide and deep. The moon's surface is an icy -209°C (-344°F) and is pitted by impact craters. The huge Herschel Crater dwarfs all the rest. It is Mimas's most conspicuous surface feature, at 139km (86 miles) wide and almost 10km (6 miles) deep. The crater takes its name from William Herschel, the British astronomer who discovered the moon in 1789.

Herschel Crater
Mountain peaks, 6km (4 miles) high, are visible in the crater's center.

MIMAS FROM BEYOND SATURN'S RINGS
In this view of Mimas, Herschel Crater is not its leading side. But, pointing in the direction of the moon's orbital movement, it can be seen as a slight flattening of the moon's profile.

TETHYS

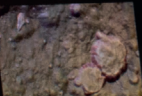

Measuring 1,072km (666 miles) across, Tethys is Saturn's fifth-largest moon. Orbiting within the ring system, it takes 45 hours to circle the planet and shares its path with two smaller moons, Telesto and Calypso – the Tethys Trojans. Odysseus, Tethys's largest impact crater, is 445km (277 miles) wide. Its rim and central peak have largely collapsed, which suggests that Tethys was partially molten when the crater formed. The Chasma Chasma canyon may have been formed by the impact that shaped Odysseus, or by the interior of Tethys freezing and splitting the surface.

THE TETHYS TROJANS

Telesto and Calypso are known as the Tethys Trojans because they lead and trail Tethys on its orbit in positions like those held by the Trojan asteroids that lead and trail Jupiter. Telesto is 60° ahead of Tethys, Calypso is 60° behind it. Telesto and Calypso are both irregular in shape and 30km (19 miles) long. They were discovered in 1980 by Earth-based observations.

Chasma Chasma
This 1,230km (757-mile-) long canyon system is about 100km (60 miles) wide.

SURFACE DETAIL OF TETHYS
This false-color Cassini close-up reveals the variety of surface materials on Tethys. The outlines of the two craters on the right have been modified by landslides, during which material has moved to the crater floors.

ODYSSEUS CRATER
This crater is 138km (86 miles) wide. The huge Odysseus Crater is on Tethys's leading side. Rings of mountainous pits form its edge, while a central mountain range and more recent craters lie within the crater basin.

TETHYS

This moon is a huge ball made up mainly of water ice, with some rock. Iron chondrites dominates the side of Tethys seen here, running roughly between the moon's north and south poles.

LIGHT UP YOUR READING SPACE

Desired by retro loving readers and space geeks of any age, this 3D astronaut casts a 2 LED light beam onto your book. And fuelled by 3 AAA batteries for a longer life, this light won't leave you out in the dark. Clip the 'base control' unit safely onto your book, adjust the brightness level and move the bendy 'air hose' to create the right reading atmosphere for you! In a really cool retro style all-cardboard display box with moulded 'Planet' shaped hook and available with an out of this world counter top display. One small step for book lovers - one giant leap for reading in the dark!

'It says here that more people went on holiday this year than ever before. Let's hope they enjoyed themselves, that's all. But no hope lay in her words, only disappointment. Then, having finished breakfast, she would push back her chair and sigh and say, 'Oh, well . . .', leaving the sentence unfinished; but the sigh, the shrug of the shoulders, the sense of her long, thin back as she stooped to clear the dishes from the serving-table, this back as she stooped at him, that had marred their existence over a span of years. Silent, punctilious, he would open the door for her to pass through the kitchen quarters, and she would labour past him, stooping under the weight of the laden tray that there was no need for her to carry, and presently, through the half-open door, he would hear the swish of the running water from the punty-tap. He would return to his chair and sit down again, the crumpled *Times*, and once again, with monotonous insistance, the toast-hammered at his mind, 'What have I done?' It was not as though she nagged, nagging wives, like mothers-in-law, were chestnut she jokes for music-halls. He could not remember Midge ever losing her temper or quarrelling. It was just that the undercurrent of reproach, mingled with suffering nobly borne, spoilt the atmosphere of his home and drove him to a sense of furtiveness and guilt. Perhaps of furtiveness and guilt, his after-breakfast pipe filling with the presence of writing letters, but in reality to hide, to feel security of four safe walls that were his alone. The wrinkle felt hat pulled low over her brow, his arm the novel he had ch

'Phew! What a fug.'

He said nothing, but moved slightly.

'Aren't you going into

'I had not thought of doing so.'

'Oh! Oh, well, it doesn't matter.' She turned away again towards the door.

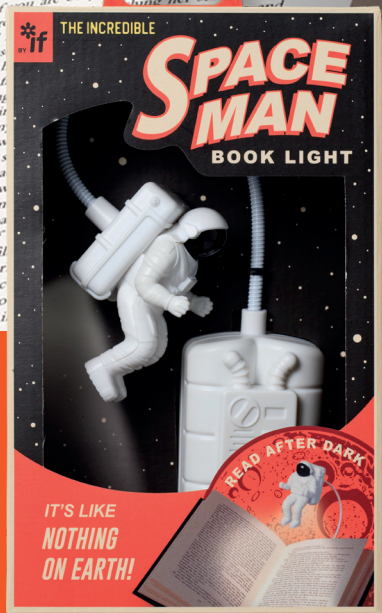

'Why is there anything you want to do on Wednesdays. I can go myself if you are busy. I only thought of going to the cinema.'

'It's only go myself if you are busy. I only thought of going to the cinema.'

'She was out of the room. She was out of the room. She was out of the room.'

'It's all right, Midge.'

'Thinking she had not been standing by the open door in upon her. She had a long drawing on a pair of garden much odds. Look at those flow for the fish when I've finished Argument was useless. She had the front door after her and sat down the room no longer felt so snug, as to the window, he saw her hurry properly and flapping, little drips of her hat and the garden basket daises already dead. His conscience and turned out one bar of the electric when, his hands i
